

FAQ

1 - To Un-install Anaconda/miniconda execute the following commands in a terminal inside ubuntu:

```
rm -rf ~/anaconda3
rm -rf ~/miniconda3
rm -rf ~/.condarc ~/.conda ~/.continuum
```

(You should one of the first two commands to not execute properly depending on which edition of anaconda you have installed previously)

2 - Proxy Server Issues in PIEAS for conda package manager.

If for some reason the above graphical methods fails then open a terminal in Ubuntu:

```
export http_proxy="http://172.30.10.11:3128"
export https_proxy="http://172.30.10.11:3128"
conda install #name_of_package
```

(Note these will only work for the current terminal session and you will have to redo the process for a new terminal)
